Amazon Web Services (AWS)

Why AWS?

Amazon Web Services (AWS) is the world's most comprehensive and broadly adopted cloud. Millions of customers—including the fastest-growing startups, largest enterprises, and leading government agencies—use AWS to be more agile, lower costs, and innovate faster.

Broadest and deepest set of cloud capabilities +

Largest community of customers and partners +

Security you can trust +

Innovation that accelerates transformation +

Most proven operational expertise +

Python: Classes

Python is an Object-Oriented Programming (OOP) language. Python provides all the standard features of Object Oriented Programming such as classes, class variables, class methods, inheritance, function overloading, and operator overloading.

Examples of a class

```
class Student:
    studentCount = 0

    def __init__(self, name, id):
        print "Constructor called"
        self.name = name
        self.id = id
        Student.studentCount = Student.studentCount + 1
        self.grades={}

    def __del__(self):
        print "Destructor called"

    def getStudentCount(self):
        return Student.studentCount

    def addGrade(self,key,value):
        self.grades[key]=value
    def getGrade(self,key):
        return self.grades[key]

    def printGrades(self):
        for key in self.grades:
            print key + ": " + self.grades[key]
```

```
>>>s = Student('Steve','98928')
Constructor called

>>>s.addGrade('Math','90')
>>>s.addGrade('Physics','85')
>>>s.printGrades()
Physics: 85
Math: 90

>>>mathgrade = s.getGrade('Math')
>>>print mathgrade
90

>>>count = s.getStudentCount()
>>>print count
1

>>>del s
Destructor called
```

SaaS, PaaS, IaaS

Cloud Computing Applications

- Banking and Financial Apps
- E-Commerce Apps
- Social Networking
- Healthcare Systems
- Intelligent Transportation Systems
- Mobile Communications

Virtualization

- Virtualization refers to the partitioning the resources of a physical system (such as computing, storage, network and memory) into multiple virtual resources.
- Virtualization is the key enabling technology of cloud computing and allows pooling of resources.
- In cloud computing, resources are pooled to serve multiple users using multi-tenancy.
- Multi-tenancy aspects of the cloud allow multiple users to be served by the same physical hardware.
